

Fix-Plate

APPLICATION

The Fixing-Plate has many application areas for framing work. It can be adapted to every situation, for paintings on canvas, canvas panels, graphic art or mounting a back surface protection. The Fixing-Plate can be bent with flat tongs or the Fixing-Plate Tongs, an accessory developed for the Fixing-Plate. The success of the Fixing-Plate arises from its unique sprung steel and the well-designed hole pattern which enables it to be mounted as required on artworks and frames.

TARGET GROUP

The Fixing-Plate has been developed for framing work and has been used since its introduction in 1982 by both museums and framers.

DESCRIPTION

The material in the Fixing-Plate is a hardened sprung steel which, even after reforming, retains its strong sprung capabilities. Other framing brackets lack this property, and are difficult to reshape. The Fixing-Plate's hole pattern, two elongated holes, makes it possible to mount the Fixing-Plate close to the artwork without damaging its edges, as well as making it easy to adapt the framing to the artwork. The colour of the Fixing-Plate is blue-black.

SIZES

The Fixing-Plate is offered in three different sizes.

Size Measurement	Large	Medium	Small
Length (mm.)	100	70	55
Width (mm.)	19	19	12,7
